

- $\min x_1 - 4x_2$   
 $s.t. \begin{cases} 3x_1 - 2x_2 \geq 6 \\ 2x_1 + 6x_2 \leq 12 \\ x_2 \geq 0 \end{cases}$
1. 向量  $(1, r)^T$  是问题在点  $(2, 0)^T$  的可行下降方向, 求  $r$  的范围。

答案:  $\frac{1}{4} < r \leq \frac{3}{2}$

2. 用二次罚函数方法求解  $\min x_1^4 + x_2^4$ , 其增广目标函数为  
 $s.t. \quad x_1 - x_2 = 1$

$\underline{x_1^4 + x_2^4 + \frac{1}{2\mu}(x_1 - x_2 - 1)^2}。$

3. 用(对数)内点障碍函数方法求解  $\min x_1^4 + x_2^4$ , 其增广目标函数为  
 $s.t. \quad x_1 + x_2 \geq 1$

$\underline{x_1^4 + x_2^4 - r \ln(x_1 + x_2 - 1)}。$

4. 用乘子法求解  $\min x_1^2 + 2x_2^2$ , 其增广 Lagrange 函数为  
 $s.t. \quad x_1 + x_2^3 = 1$

$\underline{x_1^2 + 2x_2^2 - \lambda(x_1 + x_2^3 - 1) + \frac{\sigma}{2}(x_1 + x_2^3 - 1)^2}。$

5. 用二次罚函数法求解  $\min x_1^2 + 3x_2^2$   
 $s.t. \quad x_1 + 2x_2 - 1 = 0$ 。

解: 构造增广目标函数是  $Q(x, \mu) = x_1^2 + 3x_2^2 + \frac{1}{2\mu}(x_1 + 2x_2 - 1)^2$ ,

$$\frac{\partial Q(x, \mu)}{\partial x_1} = 2x_1 + \frac{1}{\mu}(x_1 + 2x_2 - 1)$$

$$\frac{\partial Q(x, \mu)}{\partial x_2} = 6x_2 + \frac{2}{\mu}(x_1 + 2x_2 - 1)$$

求驻点:  $\frac{\partial Q(x, \mu)}{\partial x_1} = \frac{\partial Q(x, \mu)}{\partial x_2} = 0$ , 得  $x_1 = \frac{3}{7+6\mu}, x_2 = \frac{2}{7+6\mu}$ ,

令  $\mu \rightarrow 0$ ,  $x_1 \rightarrow \frac{3}{7}, x_2 \rightarrow \frac{2}{7}$ .  $x \rightarrow x^* = (\frac{3}{7}, \frac{2}{7})^T, f^* = \frac{3}{7}$ 。

6. 用内点障碍函数法(对数罚函数)求解  $\min x_1^2 + 5x_2^2$   
 $s.t. \quad x_1 + x_2 - 3 \geq 0$ 。

解: 构造增广目标函数是  $P(x, \mu) = x_1^2 + 5x_2^2 - \mu \ln(x_1 + x_2 - 3)$ ,

$$\frac{\partial P(x, \mu)}{\partial x_1} = 2x_1 - \frac{\mu}{x_1 + x_2 - 3}$$

$$\frac{\partial P(x, \mu)}{\partial x_2} = 10x_2 - \frac{\mu}{x_1 + x_2 - 3}$$

$$\text{令 } \frac{\partial P(x, \mu)}{\partial x_1} = \frac{\partial P(x, \mu)}{\partial x_2} = 0,$$

$$\text{得 } x_1 = \frac{30 + \sqrt{900 + 240\mu}}{24}, x_2 = \frac{30 + \sqrt{900 + 240\mu}}{120} \quad (\text{负号舍去})$$

$$\text{令 } \mu \rightarrow 0, \quad x_1 \rightarrow \frac{5}{2}, x_2 \rightarrow \frac{1}{2}. \quad x \rightarrow x^* = \left(\frac{5}{2}, \frac{1}{2}\right)^T, f^* = \frac{15}{2}.$$

$$\begin{aligned} 7. \text{用乘子法求解问题} \quad & \min \mathbf{x}_1^2 + 2\mathbf{x}_2^2 \\ & \text{s.t. } 2\mathbf{x}_1 + \mathbf{x}_2 - 4 = 0. \end{aligned}$$

$$\text{答案: } x^* = \left(\frac{16}{9}, \frac{4}{9}\right)^T, f^* = \frac{32}{9}.$$

8. 已知  $x^* = (1, 3)^T$  是求下面问题的 KT 点, 确定常数  $p$  的取值范围。

$$\begin{aligned} \min \quad & p\mathbf{x}_1^2 + \mathbf{x}_2^2 \\ \text{s.t. } \quad & \mathbf{c}_1(\mathbf{x}) = \mathbf{x}_1 + \mathbf{x}_2 - 4 = 0 \\ & \mathbf{c}_2(\mathbf{x}) = -3\mathbf{x}_1 + \mathbf{x}_2 \geq 0 \end{aligned}$$

解: 点  $x^* = (1, 3)^T$  处的有效集为  $I^* = \{1, 2\}$ ,

$$\nabla f(x) = (2px_1, 2x_2)^T, \quad \nabla f(x^*) = (2p, 6)^T, \quad \nabla c_1(x) = (1, 1)^T, \quad \nabla c_2(x) = (-3, 1)^T,$$

由于  $x^* = (1, 3)^T$  是问题的 KT 点,

所以存在乘子  $\lambda_1, \lambda_2$ , 使得下面条件成立。

$$\nabla f(x^*) - \lambda_1 \nabla c_1(x^*) - \lambda_2 \nabla c_2(x^*) = 0,$$

$$\lambda_2 \geq 0$$

$$\text{根据由 } \begin{pmatrix} 2p \\ 6 \end{pmatrix} - \lambda_1 \begin{pmatrix} 1 \\ 1 \end{pmatrix} - \lambda_2 \begin{pmatrix} -3 \\ 1 \end{pmatrix} = 0, \text{ 可以得}$$

$$\lambda_1 = \frac{9+p}{2}, \lambda_2 = \frac{3-p}{2}.$$

$$\text{由 } \lambda_2 = \frac{3-p}{2} \geq 0, \text{ 解得 } p \leq 3.$$

9. 求最优化问题 
$$\begin{array}{ll} \min & \mathbf{x}_1 + \mathbf{x}_2 \\ \text{s.t.} & \mathbf{c}(\mathbf{x}) = 2 - \mathbf{x}_1^2 - \mathbf{x}_2^2 \geq 0 \end{array}$$
 的可行域内的 KT 点。

答案:  $(1,1)^T$

10.  $f: R^n \rightarrow R$  为可微凸函数, 证明  $\mathbf{x}^*$  为优化问题 
$$\begin{array}{ll} \min & f(\mathbf{x}) \\ \text{s.t.} & \mathbf{x} \geq 0 \end{array}$$
 的最优解的充要条件是  $\mathbf{x}^* \geq 0, \nabla f(\mathbf{x}^*) \geq 0, (\nabla f(\mathbf{x}^*))^T \mathbf{x}^* = 0$ 。

证明:  $\min_{\mathbf{x} \geq 0} f(\mathbf{x})$  是凸规划问题, KT 条件是最优解的充要条件。

问题有  $n$  个约束, 约束函数的梯度为  $\mathbf{e}_i (i=1,2,\dots,n)$ , 显然线性无关, 该问题的 KT 条件是存在乘子向量  $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_n)$ , 使得

$$\nabla f(\mathbf{x}^*) - \sum_{i=1}^n \lambda_i \mathbf{e}_i = 0, \quad \lambda_i x_i = 0, \quad \lambda_i \geq 0。$$

结合解得可行性条件得最优解的充要条件是

$$\mathbf{x}^* \geq 0, \quad \lambda = \nabla f(\mathbf{x}^*), \quad \lambda_i x_i = 0, \quad \lambda_i \geq 0。$$

充分性: 若  $\mathbf{x}^* \geq 0, \nabla f(\mathbf{x}^*) \geq 0, (\nabla f(\mathbf{x}^*))^T \mathbf{x}^* = 0$ ,

令  $\lambda = \nabla f(\mathbf{x}^*)$ , 则有  $\mathbf{x}^* \geq 0, \lambda = \nabla f(\mathbf{x}^*) \geq 0, \lambda^T \mathbf{x}^* = 0$ 。

$\mathbf{x}^*, \lambda$  两个非负向量的内积为零, 显然有  $\lambda_i x_i = 0 (i=1,2,\dots,n)$ 。

必要性: 若  $\mathbf{x}^* \geq 0, \lambda = \nabla f(\mathbf{x}^*), \lambda_i x_i = 0, \lambda_i \geq 0$ 。

则  $\mathbf{x}^* \geq 0, \nabla f(\mathbf{x}^*) \geq 0$ ,

$$(\nabla f(\mathbf{x}^*))^T \mathbf{x}^* = \sum_{i=1}^n \lambda_i x_i = 0。$$

$$\min (\mathbf{x}_1 - 1)^2 + (\mathbf{x}_2 - 2)^2$$

补充 1: 求优化问题可行域内的 KT 点,  $\text{s.t. } \mathbf{c}_1(\mathbf{x}) = \mathbf{x}_1 - 2 \geq 0$

$$\mathbf{c}_2(\mathbf{x}) = \mathbf{x}_1 + \mathbf{x}_2 = 0$$

解:  $\nabla f(\mathbf{x}) = (2(\mathbf{x}_1 - 1), 2(\mathbf{x}_2 - 2))^T$ ,  $\nabla c_1(\mathbf{x}) = (1, 0)^T$ ,  $\nabla c_2(\mathbf{x}) = (1, 1)^T$

$$\nabla f(\mathbf{x}^*) - \lambda_1 \nabla c_1(\mathbf{x}^*) - \lambda_2 \nabla c_2(\mathbf{x}^*) = 0$$

由 KT 条件, 存在乘子  $\lambda_1, \lambda_2$ , 使得  $\lambda_1 c_1(\mathbf{x}^*) = 0$ ,

$$\lambda_1 \geq 0$$

根据  $\nabla f(\mathbf{x}^*) - \lambda_1 \nabla c_1(\mathbf{x}^*) - \lambda_2 \nabla c_2(\mathbf{x}^*) = 0$

$$\text{得} \begin{pmatrix} 2(x_1^* - 1) \\ 2(x_2^* - 2) \end{pmatrix} - \lambda_1 \begin{pmatrix} 1 \\ 0 \end{pmatrix} - \lambda_2 \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

根据  $\lambda_1(x_1^* - 2) = 0$ ，可得  $\lambda_1 = 0$  或  $x_1^* = 2$

情形 1:  $\lambda_1 = 0$

$$\text{此时可得: } x_1^* = -\frac{1}{2}, x_2^* = \frac{1}{2}, \lambda_2 = -3,$$

但  $(-\frac{1}{2}, \frac{1}{2})^T$  不满足可行条件  $x_1 - 2 \geq 0$ ，故舍去

情形 2:  $x_1^* = 2$

$$\text{利用 } x_1^* + x_2^* = 0, \text{ 得 } x_2^* = -2, x_1^* = -\frac{1}{2}, x_2^* = \frac{1}{2}, \lambda_2 = -3$$

$$\text{再由} \begin{pmatrix} 2(x_1^* - 1) \\ 2(x_2^* - 2) \end{pmatrix} - \lambda_1 \begin{pmatrix} 1 \\ 0 \end{pmatrix} - \lambda_2 \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \begin{pmatrix} 2 - \lambda_1 - \lambda_2 \\ -8 - \lambda_2 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \end{pmatrix}$$

$$\text{解得: } \lambda_1 = 10 > 0, \lambda_2 = -8$$

所以  $(2, -2)^T$  为可行的 KT 点。

补充 2: 求下面问题的可行域内的 KT 点

$$\begin{aligned} \min \quad & x_1^2 - x_2 + 3x_3 \\ \text{s.t.} \quad & c_1(\mathbf{x}) = x_1 + x_2 + x_3 \geq 0 \\ & c_2(\mathbf{x}) = x_1^2 + 2x_2 - x_3 = 0 \end{aligned}$$

$$\text{解: } \nabla f(\mathbf{x}) = (2x_1, -1, 3)^T, \nabla c_1(\mathbf{x}) = (1, 1, 1)^T, \nabla c_2(\mathbf{x}) = (2x_1, 2, -1)^T$$

$$\nabla f(\mathbf{x}) - \lambda_1 \nabla c_1(\mathbf{x}) - \lambda_2 \nabla c_2(\mathbf{x}) = 0$$

可行的 KT 点满足条件  $\lambda_1 c_1(\mathbf{x}) = 0$ ,

$$\lambda_1 \geq 0$$

$$\text{根据 } \nabla f(\mathbf{x}) - \lambda_1 \nabla c_1(\mathbf{x}) - \lambda_2 \nabla c_2(\mathbf{x}) = 0 \text{ 得} \begin{pmatrix} 2x_1 \\ -1 \\ 3 \end{pmatrix} - \lambda_1 \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} - \lambda_2 \begin{pmatrix} 2x_1 \\ 2 \\ -1 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix}$$

$$\text{进而解得: } \lambda_1 = \frac{5}{3}, \lambda_2 = -\frac{4}{3}, x_1 = \frac{5}{14}$$

$$\text{根据 } \lambda_1 c_1(\mathbf{x}) = 0, \lambda_1 \neq 0 \text{ 可得: } c_1(\mathbf{x}) = x_1 + x_2 + x_3 = 0$$

联合  $\boldsymbol{c}_2(\boldsymbol{x}) = \boldsymbol{x}_1^2 + 2\boldsymbol{x}_2 - \boldsymbol{x}_3 = 0$  , 得到  $x_2 = -\frac{95}{588}$  ,  $x_3 = -\frac{115}{588}$

由于  $\lambda_1 = \frac{5}{3} > 0$  ,  $(\frac{5}{14}, -\frac{95}{588}, -\frac{115}{588})^T$  为可行的 KT 点。
